MRI Of Cervical Spine

Sagittal T1 & T2, Axial T1 & T2 and STIR weighted images.

Findings:

- Loss of cervical lordosis.
- Marginal osteophytes noted at different vertebral level.
- The atlanto-occipital joint shows normal morphologic pattern.
- The atlanto-dense interval is maintained.
- The vertebral bodies are normal in density.
- No evidence of any lytic or sclerotic lesion.
- Rest of intervertebral disc spaces appears normal in height and signal intensity.
- No evidence of any fracture or dislocation.
- The paraspinal soft tissues appear to be normal. No mass or collection is seen at the paraspinal region.

ON CT screening: Comminuted displaced fracture at left side of body of mandible, Polypoidal mucosal thickening in right maxillary sinus & circumferential mucosal thickening in left maxillary sinus.

Impression:

- Loss of cervical lordosis.
- Marginal osteophytes at different vertebral level

This is professional opinion based on imaging findings and not the diagnosis. It should be clinically correlated to arrive at a proper conclusion. Not valid for medico-legal purpose.
